Positive selection of the transformed cells is achieved without directly damaging the neighbouring non-transformed cells. The transformed cells may be identified by simple visual means without the use of a separate assay to determine the presence of a marker gene. This technique also avoids the release of antibiotics or other dangerous genes into the environment. The present sequence is Escherichia coll strain C ribitol dehydrogenase encoded by ribitol operon (rtl operon).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to DNA sequences encoding enzymes required for clavulanic acid blosynthesis. Clavulanic acid is a broad spectrum beta-lactamase inhibitor and is an important antibiotic for the treatment of infectious diseases. Also provided in the patent is a 15 Kb genomic DNA fragment downstream to pcbC gene from Streptomyces clavuligerus. The genomic DNA comprises 10 open reading frames (ORFs), eight of which are involved in clavulanic acid biosynthesis. The present sequence is S. clavuligerus clavulanic acid biosynthesis enzyme encoded by ORF9.

The enzyme is derived from the mycelium of a Streptomyces species, especially S. clavuligerus (e.g. ATCC 27064), S. jumojensis (e.g. ATC 2864) or S. katsurahhamanus (e.g. ATCC 27064). The present sequence represents the enzyme from S. clavuligerus ATCC 27064.

The obtained clavulanic is in turn a key ingredient in the antibiotic Augmentin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Arnell J,

The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections,

The present invention provides human cDNAs, proteins and related gen DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequise a protein of the invention.
                                                                                                                                                                                                  Isolated nucleic acid polypeptide is used in condition

The present invention relates to the isolation of novel human enzyme C polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences c encoding them. The enzyme polypeptides of the invention may comprise the functional classes of exidoreductases, transferases, hydrolases, lyases, c isomerases or ligases. The sequences of the invention are useful in the c diagnosis, treatment, prevention and/or prognosis of a wide range of exidoredres including hyperproliferative disorders (e.g. cancer), c immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. cancer), c (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), c metabolic disorders (e.g. henylketconuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), c (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis). The blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The c polypucleotides of the invention can also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                     17-NOV-2000

Sequences AAU18282-AAU18507 represent endocrine polypeptides of the invention. Endocrine polypeptides and their associated polynucleotides are useful in the diagnosis, treatment and prevention of various types disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by determining the presence or absence of a mutation in an endocrine polynucleotide. The treatable disorders include autoimmune diseases suc
                                                                                                                                                                  Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    glomerulonephritis and respiratory disorders such as asthma. The polypeptides can also be used to aid wound healing, to prevent skin aging due to sunburn, to maintain organs before transplantation, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire, wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                  disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia an epilepsy; and (f) infectious diseases such as viral, bacterial, fung and parasitic infections.
                                                                                                                                                                                                                                                                                                                            and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes meilitus, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel genes (AAI62752-AAI62961) and proteins (AAM43347-AAM42415) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 11;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel plasma membrane associated proteins useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancer, immune response and neuronal disorde
                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rosen

         The present invention relates to methods for stimulating or inhibiting angiogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, pR0179, pR0238, PR0364, PR0844, PR0846, PR0160, PR0205, PR0321, PR0332, PR0840, PR0877, PR0878, PR0879, PR0882, PR0885 or PR0887. These proteins were identified by isolating cDNA clones encoding secreted
 proteins were proteins. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a PRO protein of the invention.
                                                                                                                                                                                                                                                                                                Human; anglogenesis; cardiant; cytostatic; antianglogenic; hypotensive; vulnerary; antiarteriosclerotic; PRO agonist; PRO antagonist; trauma; gene therapy; cardiovascular disorder; endothelial disorder; cancer; anglogenic disorder; cardiac hypertrophy; atherosclerosis; hypertension; age-related macular degeneration; arterial restenosis; angina; rheumatoid arthritis; myocardial infarction; thrombophlebitis;
                                                                                                                                                                                      03-JAN-2002

                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                  activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL88267 represent primers and probes used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10-NOV-2000

The polypeptides are useful for treating or preventing a disorder associated with decreased expression or activity of OXRE. Antagonists OXRE are useful for treating or preventing a disorder associated with increased expression or activity of OXRE. The disorders include cell proliferative disorders (cirrhosis, hepatitis), cancer (leukemia, melanoma), hypopituitarism and hyperpituitarism, hypothyroidism and hyperthyroidism, metabolic disorders (Addison's disease, cystic fibrosis), reproductive disorders (infertility, ovulatory defects), neurological disorders (Alzheimer's disease, Parkinson's disease, multiple sclerosis), mental disorders (anxiety, schizophrenia),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 autoimmune/inflammatory disorders (acquired immunodeficiency syndrome (AIDS), asthma, osteoarthritis), and viral infections. The polynucleotides may be used in Southern or Northern analysis, polymerase chain reaction (PCR), or in enzyme-linked immunosorbent assays (ELISA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
